

Backup Solution

Pragmatic Agility | February 8, 2021

The backup files should "sync" to the AWS S3 bucket. Files that exist on the local servers should exist on AWS and files that do not exist on the local servers should not exist on the AWS cloud. The automation server is a Linux server and both the local servers and the AWS buck will be implemented to appear as local mapped drives. This means the program only needs to move files around in what appears to be a local enviroment.
