Collection Agency: Score Accounts

Pragmatic Agility | February 12, 2021

Scores and Transforms File

Automation server runs programs via the crontabin loops relevant to the process they are completing

Expectations:

The Python program must read a CSV file, parse the data and transform it into a file that the dialer can parse. The dialer automatically loads files in the correct directory with the correct name.

During the ETL process, the Python program must score the accounts using the provided method. The dialer will then use the score to call accounts respective to score high to low.
